Apache "Module mod_alias does not exist"

I installed apache on Debian:

```
sudo apt-get install apache2 apache2-utils
```

and ran

```
a2enmod cgi alias env
```

I want to use `ScriptAlias` command. However I get the message Command is missing.

I find this answer where suggestion was made that I should use

```
a2enmod mod_alias
```

When I use it I get the message

```
Module mod_alias does not exist
```

Do you have any suggestions how to solve this ?

I try to configure git with these instructions.

/ debian　　/ apache-httpd

This question came from our site for professional and enthusiast programmers.

Shouldn't necessarily need to do this but did restart apache afterwards? – Panama Jack Dec 15 '15 at 21:49

1 Answer

Under debian, you can load the mod_alias module using:

```
$ sudo a2enmod alias
```

You should see two symbolic links `alias.conf` and `alias.load` in the folder
`/etc/apache2/mods-enabled` .

After running this command, make sure that your current httpd configuration is correct using the following command:

```
$ sudo apache2ctl configtest
```

If no error message appears, restart the httpd server in order to activate this configuration change:

```
$ sudo service apache2 restart
```
